Activity 14 · Effectiveness Decision Capstone

TGS-2022017520 · v14.0 · Synthetic training data

Goal

A synthetic cross-channel campaign has spend, leads and revenue. Teams combine Cowork evidence synthesis and Claude Code calculations into a budget recommendation with attribution sensitivity, margin boundaries and a human approval record.

Before you start

Use a copied activity folder,Claude Cowork or Claude Code as specified,and a spreadsheet or Python3 for independent checks. No production credentials are needed. Product access varies;CSV fallback remains valid.

Mock data and assets

mock-data/campaigns.csv

All named customers,competitors,campaigns and values are fictional. Assets include brand,source,measurement and decision contracts.

Mechanism

Reconcile inputs -> compute denominator-aware metrics -> apply margin -> inspect attribution -> challenge confounders -> recommend bounded test -> human approve -> monitor.

Digital Marketing’s strategy evaluation is operationalised as denominator-aware metrics,margin reconciliation and a capped human-approved experiment. Vendor tool lists are capability prompts,not measured evidence of business improvement.

Worked calculation

Paid CPL=$1200/30=$40; revenue ROAS=2; contribution after spend=$2400×0.5-$1200=$0. ROAS is not profit or causal ROI.

Step-by-step

1. Inspect campaigns.csv and reconcile leads96,spend2100,revenue6000.
2. Read assets/decision-template.md and margin-boundaries.md.
3. Ask Claude Code Prompt 1 for deterministic calculations; review before running.
4. Verify paid CPL40,ROAS2,contribution0 and total contribution900.
5. Use Cowork to synthesise calculations with evidence from prior activities.
6. Ask Prompt 2 to red-team profitability,attribution and privacy claims.
7. Design a capped experiment with metric,control,window,stop rule and owner.
8. Save report,budget test and approval record showing human approval pending.

Prompt1

Create an evidence-linked effectiveness report from synthetic campaigns.csv and earlier activity outputs. Calculate CPL, revenue ROAS and contribution after listed spend. Explain attribution and causal limits. Recommend a capped test; keep approval pending and do not change or publish campaigns.

Prompt2

Challenge the previous result. Find denominator errors,unsupported claims,bias,privacy risks and unexecuted tool boundaries. Cite exact row IDs or fields. Revise the report without inventing data.

Acceptance evidence

96 leads; spend $2100; revenue $6000; contribution $900; paid CPL40 and contribution0; human approval pending.

Failure and recovery

The report calls paid search profitable because ROAS is 2. At a 50% gross margin, contribution after media spend is zero before other costs.

State attribution model, accounting coverage and consent limitations. Cap recommendations to a test budget and require human sign-off before publishing or changing campaigns.

Submit

effectiveness-report.md,budget-test.csv and approval-record.md

Save outputs in this working copy. Keep an execution note stating which product actions actually ran and which used fallback.
